INTERESTS

I'm interested in using, improving, and designing application-specific hardware accelerators for Deep Neural Networks (DNNs), for science applications. Specifically, using compiler techniques such as symbolic execution, and mathematical optimization techniques such as integer programming, to improve memory consumption and inference latencies of DNNs on GPUs, FPGAs, and ASICs.

EDUCATION

Ph.D., **Computer Science**, *University of Chicago*, GPA: 4.0	**Oct. 2020 — Present**
M.S., **Computer Science**, *University of Chicago*, GPA: 4.0	**Aug. 2020 — Feb. 2022**
B.S., **Pure Math**, **Honors**, *Florida State University*, GPA: 3.7	**Aug. 2007 — Dec. 2010**

EXPERIENCE

Compiler Research Intern, *AMD*   **June 2023 — Current**
- eDSL design for tiled, spatial, architecture with programmable data movement (AI Engine).
- ILP for loop tiling, memory allocation, and congestion-aware routing.
- MLIR development and upstream contribution.

Compiler Research Intern, Torch-MLIR, *nod.ai*   **Feb. 2022 — June 2022, Sept. 2022 — June 2023**
- Built an end-to-end compiler for PyTorch models (through Torch-MLIR) which functions independently of PyTorch (https://github.com/nod-ai/PI).
- Built out first implementation of eager-mode for Torch-MLIR using `torch_dispatch` and JITing techniques.
- Implemented various new "ops" and infrastructure (including, extending C bindings).

Distributed Systems Research Intern, PyTorch, *Facebook*   **June 2022 — Sept. 2022**
- Researched automated tensor sharding for distributed training of large models.
- Studied DP formulation of inter-node communication (`alpa`'s) overhead and contributed a $\sim$200x improvement in performance for large tensors.
- Used MLIR to explore statically inferring tensor sharding and compute paralellization strategies (based on shape analysis/refinement).

Compiler Research Intern, PyTorch, *Facebook*   **June 2021 — Feb. 2022**
- Developed functionality for statically allocating memory for reduced inference latency in production and OSS PyTorch models.
- Developed symbolic analysis techniques for inferring memory requirements of intermediate tensors in dynamic neural networks. Specifically, used and extended shape analysis in TorchScript, combined with MIP formulation of storage allocation, to derive upper bounds on sizes of intermediate tensors.

Ranking Engineer Intern, Groups, *Facebook*   **June 2020 — Sep. 2020**
- Investigated effects of repeated recommendations on conversion for Groups You Should Join (GYSJ). Specifically, developed and shipped pipelines and metrics for measuring repetition.
- Developed features used in scoring recommendations, including collecting, cleaning, and transforming data.
- Ran A/B tests on 100MM population to measure efficacy of aforementioned features in reducing repetition and increasing conversion. Effects were marginal (i.e., not statistically significant).

Graduate Research Assistant, Globus Labs, *University of Chicago*   **Oct. 2020 — Present**
- eDSL design for tiled, spatial, architecture with programmable data movement (AI Engine).
- Built an end-to-end open-source flow from PyTorch to FPGA, using MLIR, LLVM, and Vitis HLS. Currently exploring affine loop transformations.
- Investigated a design workflow that allows exploring algorithmically complex hardware designs and developing reusable hardware libraries for the needs of scientific instruments at the edge. Specifically, investigated

Chisel and other HDLs for designing DNNs and compression algorithms.

- Helped develop a workflow that connects the Data and Learning Hub for Science (DLHub), a repository for publishing AI models, with the Hardware-Accelerated Learning (HAL) cluster, using funcX as a universal distributed computing service. Specifically, deployed Autoencoder models for identifying binary black hole mergers in LIGO data.
- Developed a hybrid CPU-GPU Difference of Gaussians method for characterizing the volume distribution of unburnt nanoparticle synthesis solution, to enable near-real-time optimization and steering of Flame Spray Pyrolysis experiments.

SKILLS

Formal Languages	Python, C++, Rust, SQL, CUDA, Scala
Human Languages	English (native), Russian (native)
Platforms	LLVM, MLIR, PyTorch, TensorFlow, PostgreSQL
Skills	Deep Learning, Compilers, Hardware, Baking
Coursework	*Computer Science*: Quantum Computing, Deep Learning Systems, Analysis of Algorithms, Consensus and Economics, Automata
	Math: Statistics, Numerical Linear Algebra, Optimization, Real Analysis, Topology, Algebra, PDEs
	Physics: Computational Physics, Electricity and Magnetism, Quantum Mechanics, Statistical Mechanics, Nuclear Physics, Waves and Optics
